Example Question #5 : Solving Absolute Value Equations. We start by finding the midpoint of the interval, which is enclosed by 60% of 204 and 80% of 204. We find the midpoint, or average, of these endpoints by adding them and dividing by two: 142.5 is exactly 20.5

Absolute value equations are equations where the variable is within an absolute value operator, like $|x-5|=9$. The challenge is that the absolute value of a number depends on the number's sign: if it's positive, it's equal to the number: $|9|=9$. If the number is negative, then the absolute value is its opposite: $|-9|=9$.

To clear the absolute-value bars, I must split the equation into its two possible two cases, one each for if the contents of the absolute-value bars (that is, if the "argument" of the absolute value) is negative and if it's non-negative (that is, if it's positive or zero).

$|a \times b| = |a| \times |b|$ Means these are the same: the absolute value of (a times b), and. (the absolute value of a) times (the absolute value of b) Which can also be useful when solving. $|u| = a$ is the same as $u = \pm a$ and vice versa Which is often the key to solving most absolute value questions.

Solving Absolute Value Equations. The next step is to split the equation up into two separate equations in the following way: $x + 1 = 6$ or $x + 1 = -6$. Notice that in the second equation, the 6 becomes negative. Finally, the last step is to solve each of the remaining equations to get $x = 5$ or $x = -7$.
