Gluteus maximus the largest and heaviest muscle in the body. It is the most superficial of all gluteal muscles that are located at the posterior aspect of hip joint. This makes it the largest muscle at the hip representing 16% of the total cross sectional area (TCSA).[1][2][3]

### Gluteus Maximus - Physiopedia

The trendelenburg gait is caused by a unilateral weakness of the hip abductors, mostly the gluteal musculature. This weakness could be due to superior gluteal nerve damage or in 5th lumbar spine lesion. This condition makes it difficult to support the body's weight on the affected side. During normal gait, both lower limbs bear half of the body weight in some part of stance phase.
