*High Voltage High Frequency Devices
Output is end point grounded and is at a high frequency of 25 to 35 khz. This higher frequency allows easy conversion to high voltage DC sources using voltage multiplier stacks. The direct high frequency output can be used to power plasma and gas discharge display tubes. All models include appropriate input and output leads for easy terminations.*

The high frequency range is approximately 800-2000 Hz. Using a 24 VDC input voltage to the circuit, the voltage output, measured using a spark gap and spherical electrodes is approximately 10-14 KV. By changing capacitors C1 and C4, one can vary the operating frequency and output voltage of the circuit, see chart below.

In practice, high power silicon systems operate at low frequencies (<10 kHz). This translates to larger passive components (e.g. inductors, capacitors) which increases volume and weight. Wide band-gap (WBG) systems can be operated at higher power and higher frequency within the space silicon devices cannot.
