How the Immune System Works

To work effectively, most immune cells need the cooperation of their comrades. Sometimes immune cells communicate by direct physical contact, sometimes by releasing chemical messengers. The immune system stores just a few of each kind of the different cells needed to recognize millions of possible enemies.

Understanding the Immune System: How it works

Your immune system responds and eliminates the invaders while the skin heals itself and seals the puncture. In rare cases the immune system misses something and the cut gets infected. It gets inflamed and will often fill with pus. Inflammation and pus are both side-effects of the immune system doing its job.

Seeing Your Immune System - How Your Immune System Works ...

How the Immune System Works. The immune system is your body's natural defense system. It's an intricate network of cells, tissues, and organs that band together to defend your body against invaders. Those invaders can include bacteria, viruses, parasites, even a fungus, all with the potential to make us sick.

Boosting Your Immune System, How the Immune System Works ...

Innate immune system. There are two main parts of the immune system: the innate and the adaptive immune system. The evolutionary older innate immune system provides a general defense against pathogens, so it is also called the nonspecific immune system. It works mostly at the level of immune cells like “scavenger cells” or “killer cells.”
