The finite difference operator $\delta^2 x$ is called a central difference operator. Finite difference approximations can also be one-sided. For example, a backward difference approximation is, $\delta U_i = U_i - U_{i-1}$ and $\delta^2 U_i = U_i - 2U_{i-1} + U_{i-2}$.

The finite difference, is basically a numerical method for approximating a derivative, so let's begin with how to take a derivative. The definition of a derivative for a function $f(x)$ is the following Now, instead of going to zero, lets make h an arbitrary value.

Mathematics degree programme at the Manchester Metropolitan University, UK. The Finite Volume Method (FVM) is taught after the Finite Difference Method (FDM) where important concepts such as convergence, consistency and stability are presented. The FDM material is contained in the online textbook, (Introductory Finite Difference Methods for PDEs) which is free to download from this website.

In numerical analysis, finite-difference methods (FDM) are discretizations used for solving differential equations by approximating them with difference equations that finite differences approximate the derivatives.

Finite Difference Methods for Hyperbolic Equations. 3.1. Introduction. Most hyperbolic problems involve the transport of fluid properties. In the equations of motion, the term describing the transport process is often called convection or advection. E.g., the 1-D equation of motion is. $\rho \frac{du}{dt} = \rho u \frac{du}{dx}$.

The book Numerical Solution of Partial Differential Equations by the Finite Element Method by Claes Johnson is a fairly good introductory book if you are mainly interested in implementing and using the finite element method. It skips most of the Hilbert space theory needed to make the arguments rigorous.

Principle of finite difference method (We have learned in Chapter 2 that differential equations are the equations that involve derivatives. (Physically, a derivative represents the rate of change of a physical quantity represented by a function with respect to the change of its variable(s): $f'(x) = \lim_{\Delta x \rightarrow 0} \frac{f(x+\Delta x) - f(x)}{\Delta x}$)
