Modeling and Control of Legged Robots Summary Introduction The promise of legged robots over standard wheeled robots is to provide improved mobility over rough terrain. This promise builds on the decoupling between the environment and the main body of the robot that the presence of articulated legs allows, with two consequences.

Modeling, Simulation and Control of Soft Robots with SOFA. With this mechanical model, it becomes possible to compute the position of the robot according to changes on the inputs of the actuators (pressure, current, displacement). We can also simulate the mechanical interaction of the robot with its environment.

dynamics, motion planning, computer vision, and control. Our goal is to provide a complete introduction to the most important concepts in these subjects as applied to industrial robot manipulators, mobile robots, and other mechanical systems. A complete treatment of the discipline of robotics would require several volumes.

Abstract. In this paper we study the modeling and control of robot manipulators with elastic joints. We first derive a simple model to represent the dynamics of elastic joint manipulators. The model is derived under two assumptions regarding dynamic coupling between the actuators and the links, and is useful for cases where the elasticity in...
