ATmega328P - 8-bit AVR Microcontrollers

It is an 8 bit CMOS built microcontroller from the AVR family (developed by Atmel Corporation in 1996) and is built on the RISC (Reduced Instruction Set Computer) architecture. Its basic advantage is it doesn't contain any accumulator and the result of any operation can be stored in any

AVR is a family of microcontrollers developed since 1996 by Atmel, acquired by Microchip Technology in 2016. These are modified Harvard architecture 8-bit RISC single-chip microcontrollers. AVR was one of the first microcontroller families to use on-chip flash memory for program storage, as opposed to one-time programmable ROM, EPROM, or EEPROM used by other microcontrollers at the time. AVR microcontrollers find many applications as

AVR Studio 7 and the Arduino Mega 2560 I've heard of the Arduino family of microcontroller boards but have not worked with one until today. I decided to take a closer look because I do know the Atmel AVR , in particular the 8-bit mega family, and an Arduino is a reasonably cheap way to get one to experiment with.
