delivers nutrients and oxygen to all cells in the body. It consists of the heart and the blood vessels running through the entire body. The arteries carry blood away from the heart; the veins carry it back to the heart.

How does the blood circulatory system work? - Informed ...

The circulatory system is important because it transports blood and other materials throughout the body. Without the circulatory system, the body does not receive oxygen, and the heart and lungs fail to work. The main organ of the circulatory system is the heart, which is responsible for pumping oxygenated blood throughout the body.

(for exhalation) and picks up oxygen.

Circulatory system - Better Health Channel

When a person inhales, the lungs expand and fill with fresh air. The respiratory system interacts with the circulatory system to transfer oxygen from fresh air to red blood cells in the lung arteries while also releasing carbon dioxide from the blood into the air in the lungs. When a person exhales, this used air leaves the body.

The Respiratory and Circulatory System in the Human Body ...

The circulatory system, also known as the cardiovascular system, consists of the organs and fluids that transport

highway systems transport people and goods through a complex network, the circulatory system transports nutrients, gases, and wastes throughout the animal body.

Overview of the Circulatory System | Boundless Biology
An open circulatory system is one in which blood does not circulate only inside blood vessels but also flows into cavities that irrigate tissues. In open circulatory systems, blood pressure is low and generally the blood (called hemolymph) has a low level of cellularity.
