If the bars before today hint that I should buy, the neural net should return 1, otherwise 0. The most simple test for the quality of the output is a simple trading strategy. It buys if the neural net signals a buy (1) and closes the position after the number of expected positive days (as demanded by classification script) have passed.

For quantitative hedge funds, investment banks, and proprietary trading firms, deep learning may be the competitive edge needed in order to revive their HFT profits. Moreover, the inclusion of real-time economic and political data could result in insights that even the most astute economists and investors could not produce, despite the complexities of the global economy.
